Bachelor of Computer Science

Abstract

In this thesis, I designed and implemented a compiler which performs optimizations that reduce the number of low-level floating point operations necessary for a specific task; this involves the optimization of chains of floating point operations as well as the implementation of a "fixed" point data type that allows some floating point operations to simulated with integer arithmetic. The source language of the compiler is a subset of C, and the destination language is assembly language for a micro-floating point CPU. An instruction-level simulator of the CPU was written to allow testing of the code. A series of test pieces of codes was compiled, both with and without optimization, to determine how effective these optimizations were.

FYP Supervisor: Xiao Xiaokui
Title: Associate Professor, Assistant Chair (Strategic Research)

Acknowledgments

I would like to express my special thanks of gratitude to my FYP supervisor (Assoc Prof. Xiao Xiaokui) who gave me the golden opportunity to do this wonderful project on the topic (GPS Trajectory Mining), which also helped me in doing a lot of Research and i came to know about so many new things I am really thankful to them. Secondly i would also like to thank my parents and friends who helped me a lot in finalising this project within the limited time frame.
